PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED NOVEMBER 28, 1964

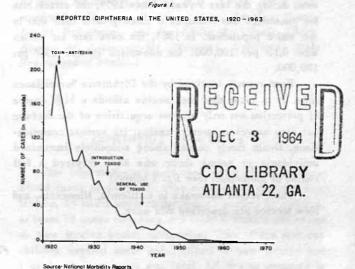

DIPHTHERIA

EPIDEMIOLOGIC NOTES

Two hundred and forty-nine cases of diphtheria have been reported in the United States thus far in 1964. There were 251 cases during a comparable period in 1963.

During all of 1963, 314 cases of diphtheria were reported in the United States. This number is the lowest recorded for any year and is a continuation of the decline in cases since the 1921 peak of 207,000. During this interval, the case rate has fallen from 201.4 per 100,000 to 0.17. There were 45 deaths due to diphtheria recorded during 1963. (See fig. 1.)

Despite this tremendous decrease in incidence, and the introduction of antitoxin and antibiotics, the case-fatality ratio has remained relatively constant. Since 1921, it has varied between 6 and 11 percent. However, in 1963, the case-fatality ratio increased to 14.3 percent resulting in the highest diphtheria case-fatality ratio ever recorded as shown in figure 2. (See fig. 1 opposite and fig. 2 on page 422.)

DIPHTHERIA (Continued from front page)

Diphtheria occurs more frequently in the South; and in 1963, 56 percent of all cases were reported from the 16 Southern States as compared to 39 percent in the Northeast and North Central States and 5 percent in the Western States.

An analysis of individual case reports to the CDC Diphtheria Surveillance Unit shows that diphtheria remains primarily a disease of children although adult cases have increased from 18 to 26 percent of the national total during the last 5 years. Since 1959, the attack rate for nonwhites has remained 6 times greater than that in the white population. In 1963, the case rate for whites was 0.10 per 100,000; for nonwhites it was 0.67 per 100,000.

From reports received by the Diphtheria Surveillance Unit, it is clear that the vaccine affords a high degree of protection not only against acquisition of the disease but also serves to protect against its serious complications. Death rarely occurs among adequately immunized individuals or among those who have received a full course of protection. (See fig. 3 below.)

Three recent outbreaks in California, Minnesota, and New Mexico are described this week.

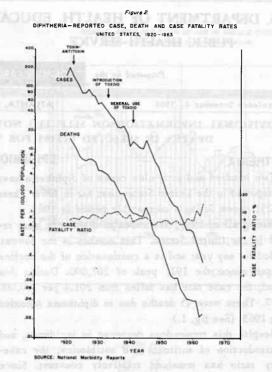

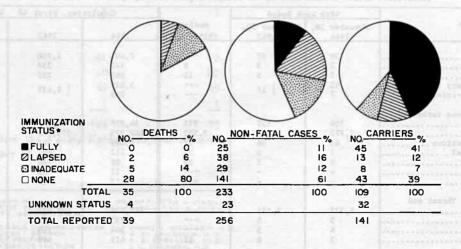

Figure 3.

DIPHTHERIA DEATHS, NON-FATAL CASES, AND CARRIERS

BY IMMUNIZATION STATUS

UNITED STATES, 1963

^{*}The criteria used in defining immunization status is as follows:

Source Diphtheria Surveillance Unit

Fully vaccinated - A completed primary series (3 or more injections) or completed primary series plus booster, obtained within 4 years of case onset.

Lapsed - A completed primary series, or a completed

primary series plus booster, obtained more than 4 years prior to case onset.

Inadequate — An uncompleted primary series, one or 2 immunizations involving diphtheria toxoid, at any time in the past.

Unimmunized - At no time prior to onset, had the patient received diphtheria toxoid.

EPIDEMIOLOGIC REPORTS

DIPHTHERIA - Minnesota

During October an outbreak of 6 cases of diphtheria occurred in a low income area in Minneapolis. Five cases occurred among pupils in an elementary school. The sixth case was from a nearby school. This sixth case had 2 siblings in the involved elementary school including a brother in kindergarten. Cases were generally mild and are shown below:

Age	Sex	Onset	Immunization Status	Severity	Grade
5	F	10-1	None	Moderate	Kindergarten
5	F	10-8	None	Mild	Kindergarten
5	М	10-15	Inadequate	Mild	Kindergarten
6	M	10-16	Fully	Moderate	Grade 1 *
5	М	10-21	None	Mild	Kindergarten
7	M	10-22	Inadequate	Moderate	Grade III

^{*}Attends a different school than the other cases but has a sibling who is a known carrier in the kindergarten class where the other cases occurred.

Extensive culturing of school and household contacts, utilizing guinea pig virulence tests, by the Minneapolis Division of Public Health and the Division of Medical Laboratories of The Minnesota Department of Health revealed a total of 9 carriers. An additional 7 suspect carriers were discovered in whose cultures suspicious bacilli were found, but whose virulence tests were unsuccessful. In addition, in 3 individuals, nonvirulent C. diphtheriae were found. It is of interest that 4 of the carriers yielded Intermedius type organisms. This type is not usually found in the Minneapolis area.

Three of the 6 cases had never been immunized, 2 had inadequate immunization and 1 had been fully immunized. Among the 9 carriers, 3 were inadequately immunized, 3 had lapsed immunization and 3 were fully immunized.

(Reported by D. S. Fleming, M.D., Director, Division of Disease Prevention and Control, Minnesota Department of Health, and C. B. Nelson, M.D., Chief, Section of Acute Communicable Diseases, Minnesota Department of Health.)

DIPHTHERIA - California

Seventeen cases of diphtheria with 3 deaths have occurred in Los Angeles County from November 1 to December 2, 1964. All of the cases are related to four family groups. Four of the patients developed diphtheric myocarditis. In addition to these known cases, 48 suspected cases have been hospitalized either because of a clinical appearance suggesting diphtheria or positive throat cultures.

(Reported by Herbert Cowper, M.D., Chief, Acute Communicable Disease Division, Los Angeles County Health Department, and Dr. Philip K. Condit, Chief, Bureau of Communicable Diseases, California State Department of Health.)

DIPHTHERIA - New Mexico

One laboratory-confirmed case and 3 clinically diagnosed cases of diphtheria have occurred in Deming, New Mexico, 65 miles north of the Mexico border. In addition, at least 10 cases occurring in Palomas, Mexico are known to New Mexico health authorities. Two of the Mexican children expired while hospitalized in New Mexico and 1 of the Deming cases was fatal. All deaths occurred in unimmunized children under 4 years of age.

The Pan American Sanitary Bureau is carrying out extensive immunizations in the Palomas area and New Mexico health authorities have established vaccination clinics in Columbus (adjacent to Palomas) while private physicians are vaccinating in Deming. No new cases have occurred in the past 4 days.

(Reported by Dr. H. G. Doran, State Epidemiologist, New Mexico Department of Public Health)

BOTULISM - Kansas

On Wednesday, November 18, 177 teen-agers participated in a music festival at Herndon, Kansas (population 321). Most of these visitors took their meals at the Herndon school but several ate at the 2 local restaurants.

On November 19, after returning to their homes, some of the participants became ill. Clinical signs and symptoms suggested botulism in 7 of the cases. Five of these 7 cases were hospitalized, 1 in Hayes, Kansas, and 4 in Denver, Colorado. One of the 5 hospitalized patients died and another continues to be confined to a respirator.

Sera from 3 of these patients were tested for botulinum toxin by Laboratory Branch, CDC. The results of these tests indicate that Clostridium botulinum type A was the etiologic agent.

Investigations by the Kansas State Department of Health revealed that a common factor in each case was the consumption of hamburgers at 1 Herndon restaurant. No cases occurred in students who ate at the school or the other restaurant in town. Nine students consumed hamburgers at the restaurant in question. Seven of these

BOTULISM - Kansas

(Continued from page 423)

ate the sliced dill pickle served on the hamburger and 2 did not. All cases occurred in the individuals who also consumed the pickles. The sliced dill pickles served on the hamburgers were home-canned by the proprietor of the restaurant. None of the suspected pickles were available for laboratory examination.

Only 2 previously recorded outbreaks of botulism in the United States have been attributed to pickles. One occurred in the State of Washington in 1925 and the second in California in 1942. In both cases, home-canned dill pickles contaminated with type A botulinum toxin were found to be the source.

(Reported by Dr. Don E. Wilcox, Division of Disease Prevention and Control, Kansas State Department of Health, and Dr. Cecil S. Mollohan, Epidemiology Section, Colorado State Department of Public Health.) 200
